How To Lower Your Energy Bills This Winter By Draught Proofing Your Residence Adequately

The seasons are changing and with that comes increased heating costs. Homeowners and renters are looking for ways to save money especially during the recession in the US. Most Americans are living paycheck to paycheck. They are looking for heating assistance but funds are tapped out. There are simple ways on how to reduce your energy bills this winter by draught proofing your home.

Draught proofing is basically stopping the flow of air from entering the residence. During the winter time, the heating system will work extra hard to try to keep the inside air warm and this becomes an issue with cold air getting into the home. Draught proofing can be a quick and easy task for the homeowner. It does not need to be expensive either. A little common sense goes a long way when it comes to home heating.

Firstly, one must inspect the home and find out where the leaks are. There are quite a few regular spots that cause air flow issues. First, check out the door and window seals. Fireplaces can also cause drafts of cold air. Be alert and check out all openings.

Once the leaks are located, a trip to the local hardware store will help the homeowner. Talk to an employee in the heating department. They know and are learning about new products that are constantly coming out on the market for heating. Most of the items are not expensive and only cost a few bucks. They will save big money over the course of a heating season.

One idea that may be suggested for leaky windows is using weather stripping. This self adhesive product is not difficult to use. It is placed around the windows and stuck into place. At the end of the season, it can be easily removed. The product itself is not expensive. It comes in a long roll that can be cut to customize to any size window. Another idea is using plastic coverings over the entire window that attaches by using a hair dryer. They are also easy to remove at the end of the season.

If a house has permanent windows that are decorative and do not open, consider using a permanent type of sealant such as silicone. It will seal the window in tightly and prevent any extra air from coming in.

Lowering heating costs over a season is a goal to most people. There are many ways this can be completed. Do it yourselfers can arm themselves with many different types of products to solve the problem. By doing a few things to the house, a homeowner can save hundreds over the course of the winter season.
